Abstract: Using Jiang function we prove $P_1 = P^{P_0} \pm m$ and $P_1 = (2P)^{P_0} \pm n$

[Chun-Xuan Jiang. **The New Prime theorem (30)** $P_1 = P^{P_0} \pm m$ and $P_1 = (2P)^{P_0} \pm n$. *Academ Arena* 2015;7(1s): 51-53]. (ISSN 1553-992X). <http://www.sciencepub.net/academia>. 30

Keywords: prime; theorem; function; number; new

Theorem 1. Let m be an even number which is not the P_0 -th power.

$$P_1 = P^{P_0} + m \quad (m \neq a^{P_0}) \quad (1)$$

where P_0 is a given prime.

For every even number m there exist infinitely many primes P such that P_1 is a prime.

Proof. We have Jiang function [1,2]

$$J_2(\omega) = \prod_P [P - 1 - \chi(P)] \quad (2)$$

where $\omega = \prod_P P$, $\chi(P)$ is the number of solutions of congruence

$$q^{P_0} + m \equiv 0 \pmod{P}, \quad q = 1, \dots, P-1 \quad (3)$$

We have

$$m^{\frac{P-1}{P_0}} \equiv 1 \pmod{P} \quad (4)$$

If (4) has a solution then $\chi(P) = P_0$. If (4) has no solutions then $\chi(P) = 0$ $\chi(P) = 1$ otherwise. For every even number. We have

$$J_2(\omega) \neq 0 \quad (5)$$

We prove that (1) has infinitely many primes solutions.

We have asymptotic formula [1,2]

$$\pi_2(N, 2) = |\{P \leq N : P_1 = \text{prime}\}| \sim \frac{J_2(\omega)\omega}{P_0\phi^2(\omega)} \frac{N}{\log^2 N} \quad (6)$$

In the same way we are able to prove $P_1 = P^{P_0} - m$

Theorem 2. Let n be an odd number which is not the P_0 -th power.

$$P_1 = (2P)^{P_0} + n \quad (7)$$

where P_0 is a given prime.

For every odd number n there exist infinitely many primes P such that P_1 is a prime.

Proof. we have Jiang function [1,2]

$$J_2(\omega) = \prod_P [P - 1 - \chi(P)] \quad (8)$$

where $\chi(P)$ is the number of solutions of congruence

$$(2q)^{P_0} + n \equiv 0 \pmod{P}, \quad q = 1, \dots, P-1 \quad (9)$$

We have

$$n^{\frac{P-1}{P_0}} \equiv 1 \pmod{P} \quad (10)$$

If (10) has a solution then $\chi(P) = P_0$. If (10) has no solutions then $\chi(P) = 0$. $\chi(P) = 1$ otherwise.

$$J_2(\omega) \neq 0 \quad (11)$$

We prove that (7) has infinitely many primes solutions.

We have asymptotic formula [1,2]

$$\pi_2(N, 2) = |\{P \leq N : P_1 = \text{prime}\}| \sim \frac{J_2(\omega)\omega}{\phi^2(\omega)} \frac{N}{\log^2 N} \quad (12)$$

In the same way we are able to prove $P_1 = (2P)^{P_0} - n$.

Remark. The prime number theory is basically to count the Jiang function $J_{n+1}(\omega)$ and Jiang prime k -tuple

singular series $\sigma(J) = \frac{J_2(\omega)\omega^{k-1}}{\phi^k(\omega)} = \prod_P \left(1 - \frac{1 + \chi(P)}{P}\right) \left(1 - \frac{1}{P}\right)^{-k}$ [1,2], which can count the number of prime

number. The prime distribution is not random. But Hardy prime k -tuple singular series

$\sigma(H) = \prod_P \left(1 - \frac{\nu(P)}{P}\right) \left(1 - \frac{1}{P}\right)^{-k}$ is false [3-8], which cannot count the number of prime numbers.

Szemerdi's theorem does not directly to the primes, because it can not count the number of primes. It is unusable. Cramr's random model can not prove prime problems. It is incorrect. The probability of $1/\log N$ of being prime is false. Assuming that the events " P is prime", " $P+2$ is prime" and " $P+4$ is prime" are independent, we conclude that P , $P+2$, $P+4$ are simultaneously prime with probability about $1/\log^3 N$. There are about $N/\log^3 N$ primes less than N . Letting $N \rightarrow \infty$ we obtain the prime conjecture, which is false. The tool of additive prime number theory is basically the Hardy-Littlewood prime tuple conjecture, but can not prove and count any prime problems[6].

Mathematicians have tried in vain to discover some order in the sequence of prime numbers but we have every reason to believe that there are some mysteries which the human mind will never penetrate. Leonhard Euler

It will be another million years, at least, before we understand the primes. Paul Erdős
