On the cover : Hamster's cheek pouch tissues after treated with Carnoy's solution and TCA, respectively.

The left top one showed the necrosis of epithelia and penetration into muscular layer after treated with Carnoy's solution for one week, with HE staining. The right top one showed disappearance of cellular structure, and the vacuolar shadow of the cells after treated with 35% TCA for one week, with HE staining. The left bottom one showed disordered arrangement of collagen fibers, the broken or even disappeared collagen fibers after treated with Carnoy's solution for one week, with Van Gieson staining. The right bottom one showed disappearance of fibroblast after treated with 20% TCA for one week, with Van Gieson staining. See *Effects of Carnoy's Solution and TCA on the Pouch Mucosa of Hamster* by Xinguang Han et al, page 35 – 40 in this issue.
