**Abstract:** In this brief note, the authors attempt to show that Einstein's variance of mass with velocity equation does not permit the existence or generation of tachyon particles/objects.

[Kalimuthu, S, Raghul Kumar, K, +Marshal Anthony, S, and #Sivasubramanian, M. **On tachyon physics**. *Nat Sci* 2021, 19(12):28-31]. ISSN 1545-0740 (print); ISSN 2375-7167 (online). <http://www.sciencepub.net/nature> 5. doi:[10.7537/marsnsj191221.05](https://doi.org/10.7537/marsnsj191221.05).

**Key words:** Real, positive, negative and imaginary numbers and quadratic equations

**MSC:** 08C99    **PACS:** 02.40 Dr.

$$\text{Let } m = \frac{i}{(1-n)^2} \text{ where } i \text{ is imaginary, } m \text{ and } n \text{ are real} \quad (1)$$

$$\text{Squaring } m^2 (1-n) = i^2 \quad (2)$$

$$\text{Replacing } i \text{ by } -1, \quad m^2 (n-1) = 1 \quad (3)$$

$$\text{i.e.,} \quad m^2 n = m^2 + 1 \quad (4)$$

$$\therefore n = 1 + \frac{1}{m^2} \quad (4a)$$

$$\begin{aligned} \text{Multiplying (3) by (n+1), i.e.,} \quad m^2 (n^2 - 1) &= n + 1 \\ m^2 n^2 - m^2 - n - 1 &= 0 \end{aligned} \quad (5)$$

Equation (5) is quadratic in n

$$\begin{aligned} \therefore n &= \frac{1 \pm [1 + 4m^4 + 4m^2]^{1/2}}{2m^2} \\ &= \frac{1 \pm [(2m^2 + 1)^2]^{1/2}}{2m^2} \\ n &= \frac{1 \pm 2m^2 + 1}{2m^2} \end{aligned} \quad (6)$$

$$\text{Taking positive value, } n = \frac{2 + 2m^2}{2m^2}, \text{ i.e., } n = 1 + \frac{1}{m^2} \quad (6a)$$

$$\text{Taking negative value in (6),} \quad n = -1. \quad (7)$$

According to the laws of quadratic equations the roots,  $\alpha + \beta = -B/A$  and  $\alpha\beta = C/A$ .

$$\text{So,} \quad \alpha + \beta + \alpha\beta = \frac{C - B}{A}. \text{Applying this relation in (5)}$$

$$\alpha + \beta + \alpha\beta = \frac{C - B}{A} = -1$$

$$\text{i.e.,} \quad \alpha + \beta + \alpha\beta + 1 = 0$$

$$\text{i.e.,} \quad \alpha(1 + \beta) + (1 + \beta) = 0$$

$$\text{i.e.,} \quad (1 + \alpha)(1 + \beta) = 0 \quad (7a)$$

$$\text{i.e.,} \quad \alpha = -1 \quad (7b)$$

(7) and (7b) are one and the same result.

From (7a) we get,  $(1 + \beta) = 0$

$$\text{Putting (6a) in the above relation,} \quad 1 + \frac{1}{m^2} + 1 = 0$$

$$\text{i.e.,} \quad 2m^2 + 1 = 0$$

$$\text{i.e., } m^2 = \frac{-1}{2}$$

$$\text{Taking square root on both sides, } m = \frac{i}{\sqrt{2}} \quad (8)$$

$$\text{Applying (8) in (1), } \frac{i}{\sqrt{2}} = \frac{i}{(1-n)^2}$$

$$\text{Squaring on both sides, } \frac{i^2}{2} = \frac{i^2}{1-n}$$

$$\text{i.e., } n = -1 \quad (9)$$

(7) and (9) are one and the same.

The above analysis establishes that  $\alpha$  and  $\beta$  are distinct. (10)

According to the laws of quadratic

equations of the general form  $Ax^2 + Bx + C = 0$ ,

the roots are distinct iff  $B^2 - 4AC = 0$  (11)

Assuming (11) in (5),  $1 + 4m^2 + 4m^4 = 0$  (1+

$$\text{i.e., } (2m^2)^2 = 0$$

$$\text{I.e., } 1 + 2m^2 = 0$$

$$\text{i.e. } m^2 = \frac{-1}{2}$$

$$\text{Taking square root on both sides, } m = \frac{i}{\sqrt{2}} \quad (12)$$

Equations (8) and (12) are one and the same.

Putting (12) in (1) we have  $n = -1$  (13)

Putting  $n = -1$  in (5) the equation satisfies.

The above analysis shows as clear as crystal that  $n = -1$

. is the only consistent solution for (5) (14)

**Discussion**

To conclude in brief, eqn. (14) does not permit the existence or generation of tachyons.
